Title: Russisa | A Nice Algebra Problem
Presenter: SALogic

1 The Problem

Given the relation

$$\sqrt[3]{x} + \sqrt{x} = \frac{4}{27}, \quad (1)$$

find the values of x over the real numbers.

2 The Solution

I like the idea of clearing of fractions, and that includes exponents, when possible. Let

$$x = u^6. \quad (2)$$

Then (1) becomes

$$u^2 + u^3 = \frac{4}{27} \quad (3)$$

Let's clear some more fractions and change the order,

$$(3u)^3 + 3(3u)^2 - 4 = 0. \quad (4)$$

One more variable change. Let

$$w = 3u \quad \text{then} \quad u^2 = \frac{w^2}{9}. \quad (5)$$

Then (4) becomes

$$w^3 + 3w^2 - 4 = 0. \quad (6)$$

By inspection, we can find the root $w = 1$. So, on dividing (6) by the factor $(w - 1)$, we get

$$w^2 + 4w + 4 = 0, \quad (7)$$

which has $w = -2$ as a double root. Okay, the roots for w go like this:

$$w = \{1, -2, -2\}. \quad (8)$$

The roots for u go like this:

$$u = \left\{ \frac{1}{3}, \frac{-2}{3}, \frac{-2}{3} \right\}. \quad (9)$$

The roots for $x = u^6$ go like this:

$$x = \left\{ \frac{1}{3^6}, \left(\frac{-2}{3} \right)^6, \left(\frac{-2}{3} \right)^6 \right\}. \quad (10)$$

However, WolframAlpha admits only $x = \frac{1}{3^6} = \frac{1}{729}$ as a root.
