

Math Diversion Problem 172

P. Reany

January 25, 2025

Zathras is used to being beast of burden to other
people's needs. Very sad life... Probably have
very sad death. But, at least
there is symmetry.
—Zathras
A character from *Babylon 5*

Title: A Proportional Problem of Ratios | Problem 294
Presenter: aplusbi

1 The Problem

Given the relation

$$\frac{b + ai}{a + bi} = \frac{4 + i}{1 + 4i}, \quad (1)$$

find the values of a, b over the real numbers.

2 The Solution

One could merely cross multiply to get a relation between a and b . When I did that, I got $\{a + bi \mid b = 4a, a \in \mathbb{R} \setminus \{0\}\}$. Obviously, we can't have both a and b equal to zero.

Now I want to try a more interesting method. Let

$$z \equiv a + bi, \quad \text{and} \quad z_0 \equiv 1 + 4i. \quad (2)$$

So, $b + ai$ can be morphed into a function of z :

$$z = a + ib, \quad (3a)$$

$$iz = ia - b, \quad (3b)$$

$$\bar{iz} = -ia - b, \quad (3c)$$

$$-\bar{iz} = b + ia, \quad (3d)$$

$$i\bar{z} = b + ia. \quad (3e)$$

Hence,

$$\frac{b + ai}{a + bi} = \frac{i\bar{z}}{z}. \quad (4)$$

And, if we do something similar to $(4 + i)/(1 + 4i)$, we get

$$\frac{4 + i}{1 + 4i} = \frac{i\bar{z}_0}{z_0}. \quad (5)$$

Putting them together, we have that

$$\frac{i\bar{z}}{z} = \frac{i\bar{z}_0}{z_0}. \quad (6)$$

On cross multiplying, we get

$$\bar{z}z_0 = z\bar{z}_0 = \overline{\bar{z}z_0}. \quad (7)$$

What we have here is a complex number that is equal to its own complex conjugate, implying that the complex number must be pure real, and that means that its imaginary part is zero:

$$\text{Im}(\bar{z}z_0) = \text{Im}[(a - bi)(1 + 4i)] = 0, \quad (8)$$

which means that

$$4a - b = 0. \quad (9)$$

And this is what we got before.
