Title: Spain | A Nice Algebra Problem | Math Olympiad
Presenter: SALogic

1 The Problem

Given the relation

$$\sqrt{1 + \sqrt{1 + x}} = \sqrt[3]{x}, \quad (1)$$

find the values of x .

2 The Solution

There's no easy route out of this pit of radicals. Let

$$a \equiv \sqrt{1 + x}, \quad \text{then} \quad a^2 = 1 + x. \quad (2)$$

So, (1) becomes

$$\sqrt{1 + a} = \sqrt[3]{a^2 - 1}. \quad (3)$$

To get out of this pit, we raise both sides to the 6th power:

$$(1 + a)^3 = (a^2 - 1)^2, \quad (4)$$

which expands to

$$a(a^3 - a^2 - 5a - 3) = 0. \quad (5)$$

The possible root $a = 0$ does not work. This leaves us with

$$a^3 - a^2 - 5a - 3 = 0. \quad (6)$$

This has a single root at $a = 3$ and a double root at $a = -1$. This latter root does not give us a root for (1). For $a = 3$, $x = 8$, which does work.
