Title: OLYMPIAD MATH
Presenter: Maths Simplified Solutions

1 The Problem

Given the relation

$$x^{x^5} = \left(\frac{1}{125}\right)^{1/75}, \quad (1)$$

find the real values for x .

2 The Preparation

I intend to use the Lambert W function, which goes as follows: If

$$ze^z = B, \quad (2)$$

then

$$z = W(B), \quad (3)$$

where there are domain constraints on B that we won't go into here. Warning: This can be a complicated (multi-valued) function to deal with.

A lemma I'll need from the theory of the Lambert W function is the following:
If

$$y \ln y = B, \quad (4)$$

then

$$\ln y = W(y \ln y) = W(B). \quad (5)$$

The following is the ‘Lambert W function base s^1 , or W_s , where s is a positive real number. Let’s begin with the relation

$$xs^x = A, \tag{6}$$

which looks very similar to (2). Then

$$x = W_s(xs^x) \equiv \frac{W(A \ln s)}{\ln s}. \tag{7}$$

But when $s = e$, we have that

$$x = W_e(xe^x) = \frac{W(A \ln e)}{\ln e} = W(A), \tag{8}$$

which is the usual Lambert W function. (By the way, the proof to this lemma is not hard. It begins with setting $s^x = e^y$ and proceeding from there.)

If s is an integer, I may resort to putting parentheses around it to distinguish it from the n -series, as such $W_{(s)}$.

One last result we’ll need is

$$\gamma = W_n(\gamma)e^{W_n(\gamma)}. \tag{9}$$

3 The Solution

Let’s begin by raising both sides of (1) to the fifth power:

$$(x^5)^{x^5} = \left(\frac{1}{125}\right)^{5/75} = \left(\frac{1}{5^3}\right)^{1/15} = \left(\frac{1}{5}\right)^{1/5} \tag{10}$$

Now we take the natural logarithm, to get

$$x^5 \ln x^5 = \frac{1}{5} \ln \frac{1}{5}, \tag{11}$$

Next, we take the Lambert W function across this equation.

$$\ln x^5 = \ln \frac{1}{5}. \tag{12}$$

After equating arguments, we have that

$$x^5 = \frac{1}{5}. \tag{13}$$

Finally, we get

$$x = \left(\frac{1}{5}\right)^{1/5}. \tag{14}$$

¹This notation I invented myself.
