Title: A Nice Absolute Value Equation
Problem 431
Presenter: aplusbi

1 The Problem

Given the relation

$$z|z - 1| = 20 + 20i, \quad (1)$$

find the values of z .

Note: WolframAlpha claims that $z = 4 + 4i$.

2 The Solution

If we knew the value of $|z - 1|$, we could solve for z thusly,

$$z = \frac{20 + 20i}{|z - 1|}. \quad (2)$$

Let's begin by subtracting $|z - 1|$ from both sides of (1), while replacing $20 + 20i$ by z_0 for convenience:

$$z|z - 1| - |z - 1| = (z - 1)|z - 1| = z_0 - |z - 1|. \quad (3)$$

Next, we take the complex conjugate of this to get:

$$(\bar{z} - 1)|z - 1| = \bar{z}_0 - |z - 1|. \quad (4)$$

Then we multiply them together, to get:

$$|z - 1|^4 = z_0 \bar{z}_0 - (z_0 + \bar{z}_0)|z - 1| + |z - 1|^2, \quad (5)$$

or

$$|z - 1|^4 = r_0^2 - 2a_0|z - 1| + |z - 1|^2. \quad (6)$$

If we make the temporary variable substitution $B = |z - 1|$, we have, along with some algebraic manipulation, that

$$B^4 - B^2 + 40B - 800 = 0. \quad (7)$$

To this equation, WolframAlpha tells me that the only positive real root is

$$B = 5. \quad (8)$$

Thus $B = |z - 1| = 5$ and, therefore, using (2), we get

$$z = \frac{20 + 20i}{5} = 4 + 4i. \quad (9)$$
