1   The Problem

Find the value of
$$8^5 + 8^4 + 8^3 + 8^2 + 8^1 + 8^0 \,. \tag{1}$$

2   Strategies

This sum is called a finite geometric series. More specifically, they are of this form
$$1 + r + r^2 + \cdots + r^n \,, \tag{2}$$

where r is a real or complex number. The 'series' means that it's a summation, and the 'geometric' means that the quotient of any two consecutive terms is fixed. In the case of (2), that quotient is r.

Now, there's a formula for this series, which is

$$1 + r + r^2 + \cdots + r^n = \frac{1 - r^{n+1}}{1 - r} \,, \tag{3}$$

which seems preferable when $|\,r\,| < 1$, else

$$1 + r + r^2 + \cdots + r^n = \frac{r^{n+1} - 1}{r - 1} \,, \tag{4}$$

seems preferable when $|\,r\,| > 1$ (though algebraically they're the same, of course).

3   The Solution

Let
$$S = 8^5 + 8^4 + 8^3 + 8^2 + 8^1 + 8^0 \,. \tag{5}$$
From the formula, we have that
$$S = \frac{8^{5+1} - 1}{8 - 1} = \frac{8^6 - 1}{8 - 1} = 37{,}449 \,, \tag{6}$$
